Introduction

Birds Korea is a small, legally-registered NGO in the Republic of Korea (ROK). We are wholly dedicated to the conservation of birds and their habitats in Korea and the wider Yellow Sea Eco-region. We have maintained bird checklists online in Korean and English since 2007, with major revisions every few years. We strive for accuracy; and we do what we can to benefit from the knowledge and expertise of others. There is no national rarities committee or record review process in the ROK; and the Birds Korea Checklist is not used or endorsed by government bodies. Nonetheless, we aim to provide the most accurate (and in some ways most detailed) information on the status of the ROK's birds available anywhere.

Because of the many information gaps that remain on historical and contemporary status of birds in Korea, we always welcome input, discussion, correction of any errors, and wide use by the birding and conservation community - here in the ROK and globally.

Primary Purpose: Conservation

The primary purpose of the Birds Korea Checklist is conservation of birds and their habitats. Like previous checklists, the 2022 Checklist is based on extensive ongoing research (including fieldwork, literature review and in more recent years, review of records submitted to eBird) and includes best knowledge known to us as of October 1st 2022.

Presented in Korean-language (Ha & Moores 2022) and English-language (Moores & Ha 2022) versions, the 2022 Checklist updates information presented in the 2018 Checklist (and earlier) on all species and subspecies divided into Categories based on level of documentation and naturalness, their seasonality, and their relative abundance.

Changes to the climate and the worsening ecological health of major habitats are increasingly apparent, both in Korea and globally. To support national and regional conservation assessments, the 2022 Checklist therefore continues to assess species as either "Irregularly Occurring" (with probably fewer than ~10 records annually) or "Regularly Occurring" (>10 records or individuals annually). Based on data and information available to us, all 365 species currently considered to be "regularly-occurring" are again sub-divided further into four colour-categories of Red, Amber, Green and Grey. At their simplest, Red indicates a very poor conservation status nationally and / or globally; Amber indicates a poor national and / or global conservation status and / or high Flyway importance; Green indicates a positive or neutral conservation status or a lack of data on population trend; and Grey indicates the apparent loss of that species, either historically or more recently, as regularly occurring in the ROK. For a detailed explanation of the selection process see Moores (2012) and Moores et al. (2014), and for their application and the codes used in this checklist, see below.

Nomenclature

As with earlier Birds Korea checklists, the order and nomenclature of English-language names of the 2022 Checklist follow the IOC World Bird List (Gill et al. 2022), with 18 exceptions (see http://www.birdskoreablog.org/?p=26235), all of which are clearly indicated with an asterisk. Popular common names for some taxa not listed by Gill et al. (2022) are also included, contained within speech-marks.

The 2022 Checklist: A Quick Summary

- 609 species are included in the list, including 575 species which are assessed as adequately documented and naturally occurring
- 365 species are assessed as currently regularly occurring; 14 as no longer regularly occurring; and 230 as "irregularly occurring", i.e., representing a mix of rare migrants and out-of-range species
- 43% of regularly occurring species are assessed nationally as having a poor or very poor conservation status (being colour-coded Red, Amber or Grey), compared with 40% of regularly occurring species in 2018
- 62 of the regularly-occurring species are now Red-Listed (an increase of four since 2018)
- 87 of the regularly-occurring species are now Amber-Listed (an increase of five since 2018)
- 216 of the regularly-occurring species are now Green-Listed (a decrease of seven since 2018)
- 14 are now Grey-Listed (an increase of six since 2018, in part because of refinements to the colour coding system)
- 563 species are listed in Category One (adequately documented and recorded in 2000 or subsequently), an increase of 18 since 2018;
- 12 species are listed in Category Two (adequately documented prior to but not in or after 2000, an increase of three since 2018 due to a revision in the cut-off point from 1980 to 2000 as the unofficial start of the modern birding era and "recent" records)
- 17 species are listed in Category 3 or 4 as credibly identified but unsupported with adequate documentation (a reduction of two since 2018)
- Three species are listed in Category 5, as adequately documented, but not originating from completely-naturally origins (one of which, Feral Rock Dove, is well-established)
- 14 species are listed in the newly revised Review Category, including five species from Category One; one species from Category Two (Short-tailed Albatross); three exotics; and several unresolved identifications. All of these species have some supporting evidence. The aim will be to present information on these species in dedicated blog posts in 2022 and 2023 to provide an opportunity for public comment and to assess whether they should be included in the checklist or not
- A small number of species included in other checklists remain intentionally excluded because they seem to be inadequately documented and / or highly anomalous at the regional level, including e.g., a Sabine's Gull in Pohang in August 1970 (included in Gore & Won 1971 without any description) and a presumed juvenile Ivory Gull on 23rd October 1995 on Ulleung Do (included in Park 2022). If similar records of these species are adequately documented within the near-region, then they can be added to Category 3 or 4 of the Birds Korea Checklist in the subsequent revision. In addition, if images or sound recordings are eventually published of the original records, or if similar records are later adequately documented in the ROK, then these earlier records can be included as first national records in Category 1. An even smaller number of species have been intentionally excluded because images reveal that the species was misidentified, e.g., White-throated Redstart *Phoenicurus schisticeps* on April 28th 2019 on Mara Do, Jeju (in Park 2022).

Categories

To help increase confidence in the records, the 2022 Checklist is divided into five main categories, with a small number of species falling into more than one category, and a sixth Review Folder.

CAT 1	Species of bird (and their subspecies) recorded in the ROK since 2000, adequately-documented with independently identifiable photographs, sound recordings and / or specimens.
CAT 2	Species of bird (and their subspecies) recorded in the ROK before 2000, credibly supported by photographs or specimens, which have not been recorded since 2000 with the same level of documentation.
CAT 3	Species of bird (and their subspecies) credibly recorded in the ROK since 2000, with the record(s) supported with a detailed description but without independently-identifiable photographs and / or sound recordings.
CAT 4	Species of bird (and their subspecies) credibly recorded in the ROK before 2000, with a detailed description but without independently-identifiable photographs or sound recordings.
CAT 5	Species with records or populations in the ROK which are part of conservation breeding programs or are likely to be not entirely naturally occurring ("exotics"). This category has six sub-categories, 5A-F.
A	Species with populations becoming established following translocation(s) since 2000 within the historic breeding range (1880-2000) in which the same species also occurs regularly in an apparently wild state.
B	Species breeding in the wild following post-2000 translocation(s) outside of the historic breeding range (1880-2000), which have also occurred in an apparently natural state since 2000.
C	Species not recorded since 2000 in an apparently natural state now breeding in the wild due to post-2000 translocation(s) outside of the historic breeding range (1880-2000).
D	Species with established breeding populations in the ROK following translocation since 2000 outside of the suspected natural breeding or non-breeding range.
E	Irregularly occurring individuals of potentially migratory species from established naturalized populations outside of the Republic of Korea (e.g., in Taiwan or Japan) that are a result of translocation(s) outside the normal range of the species.
F	Naturalized feral species – non-native species which after domestication now have established free-flying populations in the ROK.
Review	Species with records in the ROK that are supported with images, sound-recordings or specimens, but for which doubts remain about the species' identification and / or taxonomic status, and species for which there is reasonable doubt that they have ever occurred in a natural state, as they are almost entirely sedentary in their natural range, and are only likely to occur in the ROK through escape, deliberate release or on ships.

Seasonality and Abundance in the ROK ("Status")

Birds Korea Checklists use a combination of letters (indicating seasonality) and numbers (indicating estimated bands of abundance), with the season of greatest abundance listed first.

1) Seasonality

R	Resident
S	Summer Visitor
P	Passage Migrant
W	Winter Visitor

2) Abundance Bands

1	≥100,000 individuals per year
2	10,000-99,999 individuals per year
3	1,000-9,999 individuals per year
4	100-999 individuals per year
5	10-99 individuals per year
V1	Scarcely recorded, ≥10 records in total, with fewer than 10 records/year in the majority of years since 2000
V2	Rarely recorded, 1-9 records in total

Example

Tundra Bean Goose *Anser serrirostris* is listed as P1, W2, SV1. This means that >100,000 Tundra Bean Geese are present in the ROK during migration; between 10,000 and 99,999 are present in mid-winter; and that there are more than ten records in summer, but fewer than 10 records / year.

Breeding Status in the ROK ("BS")

0	No breeding records
1	Breeding confirmed since 2000
2	Breeding suspected since 2000
3	Breeding confirmed before 2000, but not subsequently
4	Breeding suspected before 2000, but not subsequently

Conservation Status (GCS and NCS)

1) Global Conservation Status (GCS)

Each species' global conservation status follows BirdLife International (2022), and is indicated by two letters. NR is used for taxa which are not recognised by BirdLife International (2022).

CR	Critically Endangered
EN	Endangered
VU	Vulnerable
NT	Near Threatened
LC	Least Concern

2) National Conservation Status (NCS)

The National Conservation Status is based on a hierarchy of criteria set out by Moores et al. (2014), with all species organized into one of 18 different subsets, sub-divided into Irregularly Occurring species (Abundance Band V1 or V2) and Regularly-occurring species (Abundance Bands 1-5).

(1) Irregularly-occurring Species with <10 records per year (but not because of historical or recent declines)

IOS Species which are not known to have been regularly-occurring at any time in the ROK.

ILT Species which were perhaps never regularly occurring in the ROK, listed as Threatened or Near Threatened by NIBR (2019).

IOR Species that might be regularly occurring but which are much-overlooked because of their habitat or behaviour but which have not been recorded regularly in the last decade, either because of declines or more likely due inadequate coverage or reporting.

(2) Regularly occurring species (probably 10 or more records or individuals per year for the majority of years during the last decade) and no longer regularly occurring species because of recent and / or historical declines.

RED is used to indicate Highest Conservation Priorities / Very Poor Global or National Conservation Status.

GCS Global Conservation Status. Species assessed by Birdlife International / IUCN (2022) as globally CR, EN, VU

TNS Threatened National Status. Species assessed by NIBR (2019) as nationally CR, EN

HDS Historical Severe Decline. Severe Historical Decline between 1900 and 1999, with no evidence of subsequent recovery, which triggered a reduction of two in Abundance Bands (Moores 2012)

BDS Breeding Decline Severe. Either Extirpation of a scarce breeding species which bred for five decades or more during the twentieth century, or an estimated decline of 50% or more of breeding population since 2000; or species considered to be widespread as breeding species at some time during the Twentieth Century currently confined to ten or fewer breeding localities/ areas.

NBS Non-breeding Severe Decline. Recent severe decline in 50% or more since the 1990s of those species considered primarily to be a non-breeding visitor to/ migrant through the ROK. In cases where the species also breeds, breeding population also considered to be in at least moderate decline.

AMBER is used to indicate High Conservation Priorities / Poor Global or National Conservation Status.

PCS Poor Global Conservation Status. Species assessed by BirdLife International / IUCN (2022) as Globally Near Threatened.

PNS Poor National Conservation Status. Assessed by NIBR (2019) as Nationally Vulnerable or Near Threatened.

HDR Long-term Historical Dzecline (pre-2010). Evidenced by a change in Abundance Band or by analysis in Moores (2012), with evidence of only partial recent recovery or weak recent decline (of <25% since 2000).

BDM Breeding Population Decline Moderate. Either (a) estimated decline of 25-49% in large breeding population (of >1,000 pairs) since 1990; or (b) measured decline of >10% between 1997-2005 and 2013-2019 (Kim et al. 2021); or (c) contraction of the breeding range so that formerly widespread species are now confined to only 10-100 sites nationwide; or (d) extirpation of an always small breeding population; or (e) decline of one or two in Abundance Bands on Birds Korea checklists (based on interpolation) between 2000 and 2022, with no evidence of recent recovery.

NBM Non-breeding Population Moderate Decline. A decline of 25-49% estimated since 2000 in the population of a species which is primarily non-breeding in the ROK. In cases where the species also breeds, the breeding population is also considered either to be stable or in decline during the same recent period.

RCP Regional Conservation Priority. Waterbird species or populations with 30% or more of their population (in accordance with Wetlands International 2022) or 20% of their global population dependent on the ROK that (A) declined historically and are not considered to have fully recovered (with their population over the past decade showing little or no trend) or (B) assessed to be in decline by Wetlands International (2022).

GREY is used to indicate species which were likely to be regularly occurring (e.g., with records of flocks) for two or more decades since 1880, but because of declines now with fewer than 10 records per year in the majority of years during at least the past decade.

NRO No Longer Regularly Occurring. Species that were likely to be historically regular in the ROK before 2000; which have fewer than 10 records annually / 10 individuals recorded in the majority of years during the last decade.

REX Regionally Extinct. Migratory species which were regularly occurring or were perhaps regularly occurring which are now assessed as Regionally Extinct by NIBR (2019); and largely sedentary species without any adequately documented records since 2000.

LAT Listed as Threatened. Species which were historically regularly occurring or were likely to be regularly occurring which are no longer regularly occurring, but which are currently Listed as Nationally Threatened by NIBR (2019)

GREEN is used to indicate low or unknown conservation priorities.

LCS Least Concern Status. In the absence of evidence of strong or moderate historical or recent declines or of a poor National Conservation Status (NIBR 2019), (a) Species regularly present in the ROK for >25 years which is assessed as Least Concern by BirdLife International (2022), with Abundance Bands 3 and 4; (b) Species regularly present in the ROK for >25 years which is assessed as Least Concern by BirdLife International (2022) with Abundance Bands 2 and 5, which might have undergone periods of decrease and periods of increase (either because of fluctuations in population or in coverage).

NAB National Abundance. All regularly-occurring species which do not meet any criteria for listing under Red or Amber, because they are abundant (Abundance Bands 1) or common (Abundance Bands 2) nationally, and are likely to be increasing or stable in population.

RRO Recently Regularly occurring. Species that have become regularly occurring since 2000, with (presumably) more than 10 records or 10 individuals in all years since 2015; and species with first breeding since 2010 that are either apparently stable or increasing.

DES Declining Species. Species suspected or known to be in recent / current decline, when declines are either insufficient or too poorly-known to trigger Red or Amber Listing.
